- Compared with 2010, there have been 334 more cases of chlamydia and 18 fewer cases of gonorrhea reported in 2011 (Tables 1 and 2). The increase is likely attributed to expanded screening and more sensitive tests, improved reporting, or may reflect a true increase in disease.
- 7% of reported chlamydia cases have no race reported and 12% of gonorrhea cases have no race reported. Re-classification of these cases could change other races' disease burdens.
- At the end of 2011 there had been nine reported cases of syphilis.
- Chlamydia is the most commonly reported disease in Montana and the US. In 2011 (n=3412), the rate of chlamydia increased by 9.2 % from 316 to 345/100,000 population (Figure 1). The national rate of chlamydia in 2010 was 426/100,000 population. The largest number of cases ever reported to CDC for any condition.
- In 2011, the rate of gonorrhea infections in Montana was 8/100,000 population (n=84) a slight decrease from 2010 compared with US rate of 100/100,000 population in 2010 (Figure 2). * Rates are based on 2010 population estimates.
